EXPERIENCE

Data Scientist III / Engineer III

Nov. 2024 – Present

Verizon

- Architected a full-stack **credit-risk platform** that synthetically generates customer data to simulate credit-policy changes and their impact on bad-debt writeoff across **\$1.2B+ in exposure**, with zero production data.
- Built churn-forecasting models and an intervention simulator (SMS, email, fee adjustments) that lifted internal decisioning coverage from **0% to 60%** and cut outsourced engagement volume by ~35%.
- Engineered **9 Python & SQL anomaly-detection microservices** on the Verizon EDW, securing CPNI data via IAM and GitLab CI/CD, saving **50+ hours/month** across 15 teams and thousands of users.
- Led 2 explainable-AI (XAI) frameworks (Streamlit/Qlik) isolating real-time drivers of Verizon Gross Adds, cutting hypothesis-generation time **73%** and presenting to **100+ stakeholders and executives**.

Data Scientist I

Jan. 2023 – Nov. 2024

Verizon

- Established a centralized data-science pipeline framework/API for Corporate Finance on GitLab, Domino Data Lab, and GCP, making cross-team collaboration **63% more efficient**.
- Automated serverless **time-series forecasting** for 9 value-segment brands (Walmart, Tracfone, Straight Talk, FiOS), pioneering a 12-hour email-report system adopted across 3 organizations.
- Built Tableau/BigQuery dashboards that eliminated **10+ hours** of weekly manual reporting; K-Means segmentation surfaced 3 at-risk cohorts that shaped new retention campaigns.

Predictive & Prescriptive Analytics Intern

Jun. 2022 – Aug. 2022

Verizon

- Built a real-time framework to automate competitor (AT&T, T-Mobile) port-in EDA via D-Tale and train DataRobot models forecasting market-share trajectories, in the internship that converted to a full-time offer.

Data Engineering Intern

Oct. 2021 – Jun. 2022

Human Genetics Institute of New Jersey

- Trained **DeepLabCut** models for kinematic pose estimation on **1,000+** wet-lab experiments (Python, TensorFlow, CUDA) and shipped 4 IMARIS extensions automating 3D lesion reconstruction, making post-microscopy analysis **5x faster**.

PROJECTS

CreditLens | *Explainable Credit-Risk Scorecard Engine* · geetpurohit.com

2026

- Built an end-to-end credit-default engine on **2.26M** LendingClub loans with weight-of-evidence binning and a logistic scorecard, benchmarked against an XGBoost/SHAP challenger and validated with ROC-AUC, KS, Gini, and calibration.
- Deployed it as a **zero-backend, in-browser app** that scores applicants and explains each decision in real time, with no target leakage.

Persuade | *Causal Uplift Modeling Engine* · geetpurohit.com

2026

- Built a causal uplift model estimating the **incremental** effect of a treatment per customer via T-learner and X-learner meta-learners, validated on the **Qini curve** (accuracy is undefined for counterfactual targeting).
- Deployed it as a **zero-backend, in-browser app** that scores customers live and sorts them into persuadables, sure things, lost causes, and sleeping dogs, focusing spend where a treatment actually moves behavior.

TECHNICAL SKILLS

Languages: Python, SQL, R, Scala, Java, JavaScript/TypeScript, $\text{\LaTeX}$

ML & Experimentation: scikit-learn, XGBoost/LightGBM, PyTorch, TensorFlow, LLMs, A/B testing, causal inference

Data, Cloud & Viz: Apache Spark, GCP/BigQuery, Airflow, dbt, Docker, PostgreSQL, Tableau, Streamlit, MLflow

EDUCATION

Georgia Institute of Technology

In Progress

M.S. in Analytics, Computational Data Analytics Track

Rutgers University

Dec. 2022

B.S. in Computer Science & B.S. in Astrophysics, Minor in Mathematics, GPA: 3.7/4.0
